

Miyazaki Prefecture, where our company is located, livestock and agriculture are the main industries here. It is a place that surrounded by abundant water and beautiful nature. In this blessed environment, we have taken root in the community based on the sales of feeds, fertilizers and pesticides. By taking advantage of our experiences in contract sales of piglets and meat pigs, and farm management, we have established our own directly-managed farm and aim for further growth.

Additionally, we have started our own production and collection of animal-feed rice, and this rice is used as raw material for compound feed for our pigs.

We will make the best use out of our management resources that we have obtained through our businesses as “sales of compound/single feed” “the producing and distributing of rice” “pig farming” to produce securer, safer, more delicious pork.

How our rice-pigs are raised

20% of the compound feed is domestic rice!
Integrated management from making seedling to pork shipping.

The domestic rice that eaten by The MK' S Rice-raised-Pigs is mainly harvested in southern Kyushu, centered on Miyakonojo City, Miyazaki Prefecture, where we live.

We grow rice from making seedlings to harvesting. Many of our reliable farmer-customers, with whom we have been connected through our rice collecting business for many years, are also using our seedlings to grow rice.

This domestic animal-feed rice is fully managed by our integrated system, from collecting, inspecting, storing, transportation to the feed manufacturers as well as involving in the compound feed production, until feeding.

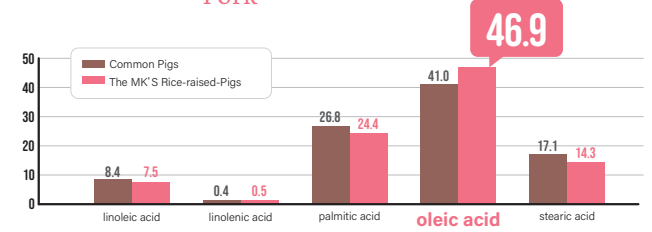

As a result, in the current situation where most of the raw materials for compound feeds are relied on imports, we are able to make our own original feed by adding 20% domestic rice.

The secret of delicious

Increase the percentage of oleic acid to increase umami component!
Improve the marbling grade!

The clear air of nature and the fresh water that gushes out from the mountains, there is no better environment for living creatures. Our pigs grow up eating domestic rice in such a beautiful place.

We do our best to maximize the original taste of pork, meanwhile, we are also able to make the fat part whiter, the lean meat redder which make it looks more delicious. Not only that, you can feel the umami while eating it, but the aftertaste is refreshing which makes you feel you can't have enough...

This is always what we are aiming at. In order to eliminate the distinct smell of pork, seaweed powder is added in the compound feed along with domestic rice.
